Example 5; Page 243-251; 262pp; English.
A recombinant vaccinta virus which codes for a HCV core protein fused to the firefly luciferase enzyme was constructed from PCR amplified fragments. The construct was useful for assaying the inhibitory activity of various antisense oligonucleotides on HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1332 T;

Disclosure; Pages 19-22; 23pp; Japanese.
086788 encodes R72800 Hepatitis C virus (HCV) T7N1-19, which
disrupts viral gene translation, by preventing the binding of
the viral mRNA to the internal ribozyme entry site. It was
used in the construction of an antiviral agent detecting vector
(Q86799 which encodes R72801, which comprises a vaccinia virus
vector, a vector containing T7N1-19 and a firefly luciferase gene.
The antiviral agent can be used to treat HCV, poliovirus, cerebral
cardio-hepatitis, human rhinovirus and foot and mouth disease viral

DNA encoding L-proline-3-hydroxylase.

L-proline-3-hydroxylase, L-proline, cis-3-hydroxy-L-proline,
2-ketoglutaric acid; ferrous ion; intermediate; drug; food additive; ds.

Streptomyces sp. strain TH1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence, derived from pTH30, isolated from Streptomyces sp., encodes an L-proline-3-hydroxylase (W09782) which converts L-proline to cis-3-hydroxy-L-proline in the presence of 2-ketoglutaric acid and ferrous ions. The DNA is used for efficient production of cis-3-hydroxy-L-proline on an industrial scale for use as an intermediate in the manufacture of drugs and as a food additive. Sequence 870 BP; 173 A; 299 C; 262 G; 136 T;
                                                                                                                                                      WPI; 94-312814/39.
A poxvirus promoter contg. an ATI promoter and prophase - useful for the production of exotic genes in large quantities for the production of exotic genes in large quantities of 21 10pp. Japanese.
Graffs and 074459 together form a double-stranded nucleotide fragment with overhanging sticky ends. The fragment comprises the ATI promoter and pro-phase expression promoter. Coding sequences (e.g. heterologous coding sequences or homologous sequences such a the poxvirus haemagglutinin gene) can be placed downstream of the promoter fragment for recombinant production of the polypeptides. 38 BP; 12 A; 7 C; 4 G; 15 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA coding for L-proline-3-hydroxylase of microbial origin - large scale production of 3-hydroxy-L-proline useful as drug intermediate or food additive

               anti-vaccinia virus. NaNBHV originated core and envelope genes were cloned. The resultant 4.01kb plasmid was named pIK4CE and its sequence determined. A recombinant vector contg. vaccinia virus (VV) TK gene with the VV 7.5kb promoter was prepd. This vector contd. VV originating TK gene with the synthetic VV early promoter. A second recombinant vector for the prepn. of VV. having the structural protein gene region of NANBHV was prepd, and used to produce a recombinant VV. The NANBHV protein was expressed in a VV infected cell.
hepatitis virus (NANBHV) and causing an antigen-antibody reaction with

```
Example 1; Fig 2; 30pp; English.

The 5'end of this strand overhangs the 3'end of its complementary strand by 4 bases (1.e. 5'-CGGG-3'); the 5' end of the complementary strand by 4 bases (1.e. 5'-CGGG-3'); the 5' end of the complementary strand overhangs the 3'end of this strand, also by 4 bases (1.e. 5'-CGGG-3'); the double-stranded fragment was lighted to other synthetic fragments containing a multiple cloning site (mcs) and a 2 directional poxvirus early transcriptional termination signal.

These were lighted downstream of a FPV promoter, initiation codon and lacZ gene (from pMC1871 and pMA001). The resulting 3.5kb containing the containing a Skb process. Inserted into vector, (Plasmid pM2173R was made by subcloning a Skb ppil series were eliminated from both junction regions and an mcs was all mcs's were eliminated from both junction regions and an mcs was inserted into 2 adjacent EcoRN fites in the cloned FPV fragment with linkers). A fragment conts, the entire coding region of Marek Disease Virus glycoprotein B homologue (gBh) was inserted into chickens. See also 034774-03478181.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Combined pox:virus promoters contain at least four promoter fragments - and pox:virus containing the combined promoters and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                     Day coding for L-proline-3-hydroxylase of microbial origin - for large scale production of 3-hydroxy-L-proline useful as drug large scale production of 3-hydroxy-L-proline useful as drug intermediate or food additive

Claim 3; Page 53-54; Blpp; Japanese.

This Kpil-Ecori fragment, derived from pTH30, which was isolated from Streptomyces sp., contains the open reading frame (T68623) that encodes an L-proline-3-hydroxylase (W09782) which converts L-proline to cis-3-hydroxy-L-proline in the presence of 2-ketoglutaric acid and ferrous ions. The DNA is used for efficient production of cis-3-hydroxy-L-proline on an industrial scale for use as an intermediate in the manufacture of drugs and as a food additive.

Kphl-EcocRi fragment of pTH30 encoding L-proline-3-hydroxylase.
L-proline-3-hydroxylase; L-proline; cls-3-hydroxy-L-proline;
2-ketoglutaric acid; ferrous ion; intermediate; drug; food additive; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A new antigenic protein which reacts with Mycoplasma gallisepticum is useful in a component vaccine for use against poultry infected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    is useful in a component vaccine for use against poultry infected with M. gallisepticum. Example 1; Page 8; 33pp; Japanese. 094699 is a promoter for the Mycoplasma gallisepticum antigenic protein TM-16 gene. TM-16 can be used as a vaccine for M. gallisepticum infectious diseases in poultry, and as a diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13-MAR-1996 (first entry)

The DNA shown is a pref. DNA fragment with E (early) promoter activity, which is used in the construction of a combined promoter for recombinant poxvirus. Combined promoters for poxvirus comprise at least four DNA fragments having a promoter activity, pref. these fragments have early and late activity, and the promoter has at least one, pref. more than two promoters. The combined promoter has a strong activity and hence is useful in an effective vaccine, esp. against poxvirus in poultry. Sequence 40 BP: 15 A; 7 C; 5 G; 13 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant fowl pox virus for use in vaccines - contains genes expressing antigens of Newcastle disease virus and opt.

Thectious bronchitis virus
Infectious bronchitis virus
Disclosure, Page 62; 85pp; English.

Synthetic pox viral promoters were constructed for recombinant fowlpox vectors. The four promoter cassettes - EPI, LPI, EP2 and LP2.

Care based on promoters that have been defined in the Vaccinia virus.

C Each cassette was designed to contain DNA sequences defined in Vaccinia flanked by restriction sites. Initiator Mets were also designed into each cassette such that in frame fusions could be made at either EcoRI or BamHI sites. A set of translational stop codons in all three reading frames and an early transcriptional termination signal was also engineered downstream of the in-frame fusion site.

C Four promoter cassettes were designed based on promoters that have been defined in vaccinia virus. These are EPI, LPI, EP2 and LP2.

C Goods, 070571, 070572 and 070569 respectively. Each cassette was consident to contain the DNA sequences defined in vaccinia flanked by crestriction sites which could be used to combine the cassettes in any order or combination. Initiator Mets were also designed into compose to cassette such that inframe fusions could be made at either cassette such that inframe fusions could be made at either construction and an early translational stop codons in all three reading frames and an early transcriptional termination signal composer and an early transcriptional termination signal construction of the inframe fusion site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

4 Promoter cassettes (148506-09) are based on promoters that have been defined in vaccinia virus. They respectively comprise early promoter 1 (EPI), early promoter 2 (EP2) and late promoter 2 (LP2).

Form of late promoter 2 (LP2). The promoters offer several advantages including the ability to control the strength and timing of foreign gene expression, and have been utilised in recombinant fowlows virus vectors (see also T48502-03) to control expression of foreign DNA. Recombinant fowlow viruses can be used as vectors for the delivery of specific vaccine antigens or cytokines to animals, esp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic early promoter 1 (EP1). Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       be preserved.

It currently consists of 24 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved

It currently consists of 20 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Center: Washington University Genome Sequencing Center

Sequence 1, Application US/08935377
GENERAL INFORMATION:
TILLE OF INVENTION: T Cells Specific for Target Antigens and TILLE OF INVENTION: Vaccines Based Thereon
NUMBER OF SEQUENCES: 37
CORRESPONDENCE ADDRESS:
ADDRESSE: Sterne, Kessler, Goldstein & Fox P.L.L.C
STREET: 1100 New York Avenue, N.W., Suite 600
CITY: Washington
STATE: D. C.
COUWTY: USA
IP: 20005
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.30
CURRENT APPLICATION NUMBER: US/08/935,377
FILING DATE: 22-SEP-1997
